

Package ‘kstMatrix’

September 1, 2024

Type Package

Version 1.0-0

Date 2024-09-01

Title Basic Functions in Knowledge Space Theory Using Matrix Representation

Description Knowledge space theory by Doignon and Falmagne (1999) [doi:10.1007/978-3-642-58625-5](https://doi.org/10.1007/978-3-642-58625-5) is a set- and order-theoretical framework, which proposes mathematical formalisms to operationalize knowledge structures in a particular domain. The 'kstMatrix' package provides basic functionalities to generate, handle, and manipulate knowledge structures and knowledge spaces. Opposed to the 'kst' package, 'kstMatrix' uses matrix representations for knowledge structures. Furthermore, 'kstMatrix' contains several knowledge spaces developed by the research group around Cornelia Dowling through querying experts.

cad

Knowledge spaces on AutoCAD knowledge

Description

Bases of knowledge spaces on AutoCAD knowledge obtained from querying experts.

Usage

cad

Format

A list containing seven bases (cad1 to cad6, and cadmaj) in binary matrix form. Each matrix has 28 columns representing the different knowledge items and a varying number of rows containing the basis elements.

Details

Six experts were queried about prerequisite relationships between 28 AutoCAD knowledge items (Dowling, 1991; 1993). A seventh basis represents those prerequisite relationships on which the majority (4 out of 6) of the experts agree (Dowling & Hockemeyer, 1998).

fractions

Knowledge spaces on fractions

Description

Bases of knowledge spaces on fractions obtained from querying experts.

Usage

fractions

Format

A list containing four bases (frac1 to frac3, and fracmaj) in binary matrix form. Each matrix has 77 columns representing the different knowledge items and a varying number of rows containing the basis elements.

Details

Three experts were queried about prerequisite relationships between 77 items on fractions (Baumunk & Dowling, 1997). A fourth basis represents those prerequisite relationships on which the majority of the experts agree (Dowling & Hockemeyer, 1998).

kmbasis

Compute the basis of a knowledge space

Description

kmbasis returns a matrix representing the basis of a knowledge space. If x is a knowledge structure or an arbitrary family of sets kmreduction returns the basis of the smallest knowledge space containing x .

Usage

```
kmbasis(x)
```

Arguments

x Binary matrix representing a knowledge space

Value

Binary matrix representing the basis of the knowledge space.

See Also

Other Different representations for knowledge spaces: [kmsurmisefunction\(\)](#), [kmsurmiserelation\(\)](#), [kmunionclosure\(\)](#)

Examples

```
kmbasis(xpl$space)
```

kmbasisdiagram	<i>Plot the Hasse diagram of a basis stored as a matrix</i>
----------------	---

Description

kmbasisdiagram takes a matrix representing a basis and a color vector and draws a Hasse diagram. If the color vector is NULL the states are drawn in green.

Usage

```
kmbasisdiagram(struc, horizontal = FALSE, colors = NULL)
```

Arguments

struc	Binary matrix representing a basis
horizontal	Boolean defining orientation of the graph, default FALSE
colors	Color vector (default NULL)

See Also

Other Plotting knowledge structures: [kmhasse\(\)](#)

kmcolors	<i>Determine a color vector based on probabilities</i>
----------	--

Description

kmcolors takes a probability vector and a color palette and creates a color vector to be used with kmhasse.

Usage

```
kmcolors(prob, palette = cm.colors)
```

Arguments

prob	Probability vector
palette	Color palette (default = cm.colors)

kmdist	<i>Compute the distance between a data set and a knowledge structure</i>
--------	--

Description

kmdist returns a named vector with the frequencies of distances between a set of response patterns and a knowledge structure. This vector can be used to compute, e.g., the Discrepancy Index (DI) or the Distance Agreement Coefficient (DA).

Usage

```
kmdist(data, struct)
```

Arguments

data	Binary matrix representing a set of response patterns
struct	Binary matrix representing a knowledge structure

Value

Distance distribution vector

See Also

Other Validating knowledge spaces: [kmvalidate\(\)](#)

Examples

```
kmdist(xpl$data, xpl$space)
```

kmeqreduction	<i>Reduce a family of knowledge states with respect to item equivalence</i>
---------------	---

Description

kmeqreduction takes a family of knowledge states and returns its reduction to non-equivalent items.

Usage

```
kmeqreduction(x)
```

Arguments

x	Binary matrix
---	---------------

Value

Binary matrix reduced by equivalences

See Also

Other Properties of knowledge structures: [kmiswellgraded\(\)](#), [kmnotions\(\)](#)

Examples

```
kmereduction(xpl$space)
```

kmfringe	<i>Compute the fringe of a state within a knowledge structure</i>
----------	---

Description

kmfringe computes the fringe of a state within a knowledge structure, i.e. the set of items by which the state differs from its neighbours.

Usage

```
kmfringe(state, struct)
```

Arguments

state	Binary vector representing a knowledge state
struct	Binary matrix representing a knowledge structure

Value

Binary vector representing the fringe

See Also

Other Neighbourhood & fringe: [kmneighbourhood\(\)](#)

Examples

```
kmfringe(c(1,0,0,0), xpl$space)
```

`kmhasse`*Plot the Hasse diagram of a knowledge structure stored as a matrix*

Description

`kmhasse` takes a matrix representing a knowledge structure and a color vector and draws a Hasse diagram. If the color vector is `NULL` the states are drawn in green.

Usage

```
kmhasse(struc, horizontal = FALSE, colors = NULL)
```

Arguments

<code>struc</code>	Binary matrix representing a knowledge structure
<code>horizontal</code>	Boolean defining orientation of the graph, default <code>FALSE</code>
<code>colors</code>	Color vector (default <code>NULL</code>)

See Also

Other Plotting knowledge structures: [kmbasisdiagram\(\)](#)

`kmiswellgraded`*Check for wellgradedness of a knowledge structure*

Description

`kmiswellgraded` returns whether a knowledge structure is wellgraded.

Usage

```
kmiswellgraded(x)
```

Arguments

<code>x</code>	Binary matrix representing a knowledge space
----------------	--

Value

Logical value specifying whether ‘`x`’ is wellgraded

References

Doignon, J.-P. & Falmagne, J.-C. (1999). Knowledge Spaces. Springer–Verlag, Berlin.

See Also

Other Properties of knowledge structures: [kmeqreduction\(\)](#), [kmnotions\(\)](#)

Examples

```
kmiswellgraded(xpl$space)
```

kmneighbourhood

Compute the neighbourhood of a state within a knowledge structure

Description

kmneighbourhood computes the neighbourhood of a state within a knowledge structure, i.e. the family of all other states with a symmetric set difference of 1.

Usage

```
kmneighbourhood(state, struct)
```

Arguments

state	Binary vector representing a knowledge state
struct	Binary matrix representing a knowledge structure

Value

Matrix containing the neighbouring states, one per row

See Also

Other Neighbourhood & fringe: [kmfringe\(\)](#)

Examples

```
kmneighbourhood(c(1,1,0,0), xpl$space)
```

kmneighbourhood	<i>Compute the n-neighbourhod of a state within a knowledge structure</i>
-----------------	---

Description

kmneighbourhood computes the n-neighbourhood of a state within a knowledge structure, i.e. the family of all other states with a symmetric set difference maximal n.

Usage

```
kmneighbourhood(state, struct, distance)
```

Arguments

state	Binary vector representing a knowledge state
struct	Binary matrix representing a knowledge structure
distance	Size of the n-neighbourhood

Value

Matrix containing the neighbouring states, one per row

Examples

```
kmneighbourhood(c(1,1,0,0), xpl$space, 2)
```

kmnotions	<i>Determine the notions of a knowledge structure</i>
-----------	---

Description

kmnotions returns a matrix representing the notions of a knowledge structure.

Usage

```
kmnotions(x)
```

Arguments

x	Binary matrix representing a knowledge structure
---	--

Value

Binary matrix representing notions in the knowledge structure

The matrix has a '1' in row 'i' and column 'j' if 'i' and 'j' belong to the same notion (i.e. are equivalent). It is a symmetric matrix with '1's in the main diagonal.

See Also

Other Properties of knowledge structures: [kmeqreduction\(\)](#), [kmiswellgraded\(\)](#)

Examples

```
kmnotions(xpl$space)
```

kmsf2basis	<i>Derive a basis from a surmise function</i>
------------	---

Description

kmsf2basis expects a surmise function data frame and returns the corresponding basis.

Usage

```
kmsf2basis(sf)
```

Arguments

sf	Surmise function
----	------------------

Value

Matrix representing the basis.

kmsimulate	<i>Simulate a set of response patterns according to the BLIM</i>
------------	--

Description

kmsimulate returns a data set of n simulated response patterns based on the knowledge structure x given as a binary matrix. The simulation follows the BLIM (Basic Local Independence Model; see Doignon & Falmagne, 1999).

Usage

```
kmsimulate(x, n, beta, eta)
```

Arguments

x	Binary matrix representing a knowledge space
n	Number of simulated response patterns
beta	Careless error probability value or vector
eta	Lucky guess probability value or vector

Details

The beta and eta parameters must be either single numerals or vectors with a length identical to the number of rows in the x matrix. A mixture is possible.

The ‘sample’ function used by ‘kmsimulate’ might work inaccurately for knowledge structures ‘x’ with 2^{31} or more states.

Value

Binary matrix representing the simulated data set

References

Doignon, J.-P. & Falmagne, J.-C. (1999). Knowledge Spaces. Springer–Verlag, Berlin.

Examples

```
kmsimulate(xpl$space, 50, 0.2, 0.1)
kmsimulate(xpl$space, 50, c(0.2, 0.25, 0.15, 0.2), c(0.1, 0.15, 0.05, 0.1))
kmsimulate(xpl$space, 50, c(0.2, 0.25, 0.15, 0.2), 0)
```

kmsurmisefunction *Compute the surmise function for a knowledge space or basis*

Description

kmsurmisefunction returns a data frame representing the surmise function for a knowledge space or basis. The rows of the data frame are ordered by item name.

Usage

```
kmsurmisefunction(x)
```

Arguments

x Binary matrix representing a knowledge space or basis

Value

Data frame representing the surmise unction of x.

See Also

Other Different representations for knowledge spaces: [kmbasis\(\)](#), [kmsurmiserelation\(\)](#), [kmunionclosure\(\)](#)

Examples

```
kmsurmisefunction(xpl$space)
```

kmsurmiserelation	<i>Compute the surmise relation of a quasi-ordinal knowledge space</i>
-------------------	--

Description

kmsurmiserelation returns a matrix representing the surmise relation of a quasi-ordinal knowledge space. If x is a general knowledge space, a knowledge structure or an arbitrary family of sets, kmsurmiserelation returns the surmise relation of the smallest quasi-ordinal knowledge space containing x .

Usage

```
kmsurmiserelation(x)
```

Arguments

x Binary matrix representing a quasi-ordinal knowledge space

Value

Binary matrix representing the surmise relation of the corresponding quasi-ordinal knowledge space

Note: The columns of the surmise relation matrix describe the minimal state for the respective item in the quasi-ordinal knowledge space.

See Also

Other Different representations for knowledge spaces: [kmbasis\(\)](#), [kmsurmisefunction\(\)](#), [kmunionclosure\(\)](#)

Examples

```
kmsurmiserelation(xpl$space)
```

kmsymmsetdiff	<i>Compute the symmetric set difference between two sets</i>
---------------	--

Description

Compute the symmetric set difference between two sets

Usage

```
kmsymmsetdiff(x, y)
```

```
kmsetdistance(x, y)
```

Arguments

x	Binary vector representing a set
y	Binary vector representing a set

Value

kmsymmsetdiff: Symmetric set difference between 'x' and 'y'
 kmsetdistance: Distance between the sets 'x' and 'y', i.e. the cardinality of the symmetric set difference

Examples

```
kmsymmsetdiff(c(1,0,0), c(1,1,0))
kmsetdistance(c(1,0,0), c(1,1,0))
```

kmtrivial	<i>Create trivial knowledge spaces</i>
-----------	--

Description

These functions create trivial knowledge spaces of a given item number. The minimal space contains just the empty set and the full item set while the maximal space is equal to the power set.

Usage

```
kmminimalspace(noi)
kmmaximalspace(noi)
```

Arguments

noi	Number of items
-----	-----------------

Details

Please note that the computation time for creating large power sets can grow quite large easily.

Value

A binary matrix representing the respective knowledge space

Examples

```
kmminimalspace(5)
kmmaximalspace(5)
```

kmunionclosure	<i>Close a family of sets under union</i>
----------------	---

Description

kmunionclosure returns a matrix representing a knowledge space. Please note that it may take quite some time for computing larger knowledge spaces.

Usage

```
kmunionclosure(x)
```

Arguments

x Binary matrix representing a family of sets

Value

Binary matrix representing the corresponding knowledge space, i.e. the closure of the family under union including the empty set and the full set.

kmunionclosure implements the irredundant algorithm developed by Dowling (1993).

References

Dowling, C. E. (1993). On the irredundant construction of knowledge spaces. *Journal of Mathematical Psychology*, 37, 49–62.

Examples

```
kmunionclosure(xpl$basis)
```

kmvalidate	<i>Validate a knowledge structure against a data set</i>
------------	--

Description

kmvalidate returns a list with three elements, a named vector with the frequencies of distances between a set of response patterns and a knowledge structure, the Discrepancy Index (DI), and the Distance Agreement Coefficient (DA).

Usage

```
kmvalidate(data, struct)
```

Arguments

data	Binary matrix representing a set of response patterns
struct	Binary matrix representing a knowledge structure

Value

A list with three elements:

dist Distance distribution vector

DI Discrepancy Index

DA Distance Agreement Coefficient

Warning

The DA computation can take quite some time for larger item sets as the power set has to be computed. For item sets with around 30 items or more, it may even crash the system due to huge memory requests.

See Also

Other Validating knowledge spaces: [kmdist\(\)](#)

Examples

```
kmvalidate(xpl$data, xpl$space)
```

readwrite

Knowledge spaces on reading and writing abilities

Description

Bases of knowledge spaces on reading/writing abilities obtained from querying experts.

Usage

```
readwrite
```

Format

A list containing four bases (rw1 to rw3, and rwmaj) in binary matrix form. Each matrix has 48 columns representing the different knowledge items and a varying number of rows containing the basis elements.

Details

Three experts were queried about prerequisite relationships between 48 items on reading and writing abilities (Dowling, 1991; 1993). A forth basis represents those prerequisite relationships on which the majority of the experts agree (Dowling & Hockemeyer, 1998).

xpl

Small example knowledge space

Description

Basis and space matrix of a small fictional knowledge space, and a small data set to be used in examples.

Usage

xpl

Format

A list containing the basis, the space, and the data matrix
